ls Program for QDOS (similar to UNIX ls)

Peter Sulzer

I have found this old program from me (it's from 1992). It was created with C68 Version 2.0. Unfortunately I cannot find a description/manual for it. What I have detected so far:

Call with (e.g.):

ex'ls':REMark prints the current DATA_USE directory in a new window (window will be destroyed after you press Enter or space, as usual with C68 windows)

ex'ls',#1:REMark prints the current DATA_USE directory to SuperBASIC channel #1

ex'ls';'-l WIN1_etc_':REMark prints the directory WIN1_etc_ with detailed information. All file header information is output: File type, file length, file dataspace, update date, backup date, file version. Unfortunately I don't know some of the output data.

You get a short help with:

ex'ls';'-?'

if you want to print this to a file use (e.g.): ex'ls';'-? >RAM1_ls_txt':REMark the ">file_name" may always be used to redirect the output to a file.

The archive includes the source plus the required module cndate_o (C68 object file) for which I cannot find the source unfortunately.

As this archive includes an executable QDOS program, **it must be unzipped on a QDOS (compatible) system**, else the necessary fileheader will be lost.

Program is published under the GNU General Public License (GPL) version 1 or newer. See above for links to this license.
